US & Italian Citizen — Authorized to work in US and EU

Education

George Washington University — Expected May 2027
Dual Degree: BS in Statistics, BA in Computer Science; Minor in Mathematics — *Washington, DC*
GPA: 3.77 | Statistics GPA: 3.88

Experience

Data Analyst Intern — Summer 2026
AnswersNow — *Remote - Washington, DC*

- Created shared rules for calculating about 25 client and therapy measures and resolved conflicting cancellation figures across teams, giving management a consistent basis for tracking performance.
- Proposed and completed a study of 2,100+ clients, finding that stronger attendance at initial appointments was linked to lower rates of leaving therapy before completion, giving the company a basis to test whether early attendance support could improve client retention.
- Combined billing, appointment, and insurance data for 1,200+ clients into a 39-chart report; uncovered worsening gaps in weekly therapy that monthly participation figures did not reveal, giving management evidence to investigate missed appointments and inconsistent care.

Digital Asset Portfolio Manager — Jan. 2013 – Aug. 2023
Self-employed — *Washington, DC*

- Founded a private digital asset fund on behalf of five investors and grew it to a multi-million-dollar value.
- Established a proven track record of long-term asset appreciation through blockchain research, disciplined risk management, and continuous portfolio rebalancing.
- Transitioned to passive management to pursue dual degree studies in Statistics and Computer Science at George Washington University.

Projects

U.S. Unemployment Rate Forecasting | *R*

- Built a reproducible R project to forecast U.S. unemployment from 942 monthly readings, keeping the final two years separate to test how accurately the model could predict new data.
- Compared forecasting methods across 10 historical test periods; the selected model beat simple forecasts on average error in a final two-year test but performed worse when larger errors were weighted more heavily, highlighting limits to consider before using forecasts for business planning.

Chaotic Attractors: Computational Exploration & Visualization | *Python*

- Built an installable Python tool that simulates and visualizes nine mathematical systems, including four custom variations, giving users a reusable way to explore complex patterns and compare results across experiments.
- Automated the search for complex patterns, screened out unsuitable results before longer simulations, and checked the remaining results for sensitivity to small changes; made the experiments more efficient and easier to repeat, inspect, and explain.

Technical Skills

Languages:	Python, R, SQL, Java
Statistical Methods:	Experimental Design & Power Analysis, Bayesian Inference & MCMC, Regression Diagnostics, Survey Sampling & Weighting, Time Series & Intervention Analysis, Survival Analysis & Competing Risks
Mathematical Methods:	Linear Algebra, Dynamical Systems & Stability Analysis, Numerical ODE Methods
Libraries & Tools:	NumPy, pandas, SciPy, Matplotlib, Git, pytest, Mode Analytics, R Markdown
Databases:	PostgreSQL
